November 28th

Hunter Hottest Sites

Eli's Work

From Last Week

- ☐ Export JSON file using top N websites, rather than exporting all. When we exceed 100 the site looks messy. Will do 25 for now. Should have this implemented by Thursday.
- ☐ ~~Try to use my Surface for the capture. If it works, I don't mind leaving it in someone's office within the library. Need to install linux on it. Will test it on Thursday. Did not work~~
- ☐ Add more known websites/add to the list. (Lila is currently collecting the IPs)

Added Mid Week

- ☒ Explain to Lila how the filtering on the bogus website works. She will give me a list.
- ☒ Export JSON file using top N websites, rather than exporting all. When we exceed 100 the site looks messy. Will do 25 for now. Should have this implemented by Thursday. Tried this in many different ways. Tried sorting by all 3 properties, but it is throwing a few sites off. Will keep working on it on it, but as of now, I will keep doing everything.
- ☐ Add some more details to the 'FAQ' page, such as the meaning of the 3 filters on the landing page.
- ☐ Comment and clean up the code a bit.

For Next Week:

- ☐ Try setting up the script on my other old laptop (Yoga 2 pro). if it works, we use it.
- ☐ Prepare for the final presentation. Clean up code, branches, etc. Meet with team some time during the weekend to get all the requirements for presentation ready.
- ☐ Work on the sorting function to display only top x websites. This is hard because I am sorting by 3 properties, number of packets, size of all packets, and number of users.
- ☐ Keep adding unwanted website to the ignoreList to optimize the code.
